

PetalEdge

Sidebar Navigation Reference

Source of truth: `frontend/src/components/dashboard/Sidebar.tsx`. One unified sidebar is shared by every project type (Object Detection and Motion alike) — only the dynamic “Impulse design” items change, driven by whichever impulse is active.

Top section

Item	Route	What it is
Dashboard	/dashboard	Project home — project info, stats, and the project switcher/creator.
Devices	/dashboard/devices	Registered hardware for this project — identity, online/heartbeat status, sensors, device keys, and (per project type) the camera or motion device panel.
Data acquisition	/dashboard/data	Where a dataset enters the project — upload images/CSV/video, or start a live device capture.
Data labeling	/dashboard/data/dataset	The main dataset-management surface: browse samples, label/relabel (including AI-assisted labeling and the labeling queue), bulk actions, train/test split.

“Impulse design” section — dynamic

Not a fixed list — built live from whichever impulse is selected in the dropdown at the top of this section.

Item	Route	What it is
Impulse switcher (dropdown, not a link)	—	Shows the active impulse’s name; expands to the full impulse list plus “Manage impulses” and “Create new impulse” actions.
Create impulse	/dashboard/impulse	The impulse builder — input block → DSP → learning block.
One item per DSP/processing block	/dashboard/impulse/{type}/parameters	Generated from <code>activeImpulse.dsp_blocks</code> — one entry per block the active impulse has (e.g. “Spectral Analysis”), linking to that block’s own parameters page.
One item per learning block	/dashboard/impulse/training	Generated from <code>activeImpulse.ml_blocks</code> — links to the training/architecture UI.

Then a fixed tail, the same for every impulse:

Item	Route	What it is
Evaluation	/dashboard/impulse/evaluation	Per-model metrics and comparison — a PetalEdge addition, not in the original Edge Impulse feature set.
Retrain model	/dashboard/impulse/retrain	Re-run training against updated data without rebuilding the impulse from scratch.

Item	Route	What it is
Live classification	/dashboard/impulse/live-classification	Real-time inference against a connected device's live stream.
Model testing	/dashboard/impulse/model-testing	Offline batch inference over saved/uploaded samples, with misclassification review.
Post-processing	/dashboard/impulse/post-processing	Tune the output pipeline after raw inference (thresholds, filtering, etc.) before it becomes a final prediction.
Deployment	/dashboard/impulse/deployment	Build and export the trained model to a target device.
Jobs	/dashboard/jobs	Every background job (DSP, training, deployment, labeling) in one dashboard with real status tracking.

Standalone section

Item	Route	What it is
Versioning	/dashboard/versions	Project-level, not impulse-level — deliberately reads no impulse state, so switching impulses never affects it. Implements point-in-time restore via full project cloning (dataset, impulses, models, training history) rather than a lightweight snapshot.

No separate “backend sidebar” exists — the backend is a pure API with no UI of its own; everything above is served from it but rendered only in this one frontend nav.
